REACH substance in Energizer Lithium Batteries

Dear Customers,

A material used in Energizer lithium batteries has recently been added to the European Union REACH list of substances that could become a candidate to Authorization of specific use. As such, Energizer has legal requirements to inform customers of the description and use of the material. The material is 1,2 dimethoxymethane, CAS 110 71 4, commonly referred to as DME. For Energizer, DME is used as solvent for electrolytes of lithium batteries. Conditions of use of batteries remain unchanged as Batteries are classified per REACH as Articles with no intended release: Do not open, do not disassemble, do not damage, do not expose to fire, do not charge, do not insert incorrectly, keep out of reach of children, do not short circuit, do not mix types, do not mix old and new batteries.

For additional information, please contact your Energizer representative.
